PROFESSIONAL SUMMARY

Full-stack engineer specialising in backend systems and production-grade APIs, with a sharp eye for frontend craft. Experienced in designing and shipping resilient Go and Node.js services, high-concurrency distributed systems, and polished React interfaces — owning the full product lifecycle from database schema to deployment. Comfortable as the sole engineer or within a team, consistently delivering measurable impact at startup pace without sacrificing code quality.

TECHNICAL SKILLS

- **Languages:** Go, TypeScript, JavaScript, Python, SQL, C
- **Backend:** Go/Fiber, Node.js, NestJS, Express, Fastify, gRPC
- **Frontend:** React, Next.js, Tailwind CSS, Framer Motion, Vite
- **Databases:** PostgreSQL, Redis, MongoDB, Elasticsearch, Supabase
- **Cloud & Ops:** Docker, AWS, Kubernetes, CI/CD, Vercel
- **Tools:** Git, Linux/POSIX, Jest, Vitest, Swagger, ESLint

RELEVANT EXPERIENCE

Frontend Engineer | *Emformance — Remote*

2025 – 2026

- Re-architected the core product web application in Next.js and Tailwind CSS, achieving a **41% reduction in initial load time** through aggressive code-splitting, dynamic imports, and asset optimisation.
- Built a library of **50+ reusable UI components** with strict accessibility standards, cutting average feature-delivery time by ~30% across the product team.
- Integrated a suite of RESTful APIs using React Query, replacing ad-hoc fetch logic with a structured caching and invalidation layer that **eliminated 90% of stale-data UI bugs** reported in prior quarters.
- Delivered pixel-perfect, mobile-first responsive layouts; raised Lighthouse **Performance to 92** and **Accessibility to 95** on critical user-facing pages.
- Implemented client-side form validation, error-boundary handling, and loading-state UX patterns that **reduced user-reported friction tickets by over 35%**.
- Introduced ESLint, Prettier, and Husky pre-commit hooks, establishing consistent code style and **cutting code-review iterations by ~25%**.
- Collaborated directly with product and design stakeholders in two-week sprints, maintaining a **100% on-time delivery rate** across all assigned milestones.

Backend Engineer — Contract | *Travel Topaz — Remote*

Jan. 2026 – Sep. 2026

- Sole backend engineer; **designed and built the entire server-side architecture from the ground up** for a dual-vertical travel platform supporting both local and international flight bookings and local and international hotel reservations.
- Engineered a **unified search and availability aggregation API** integrating multiple third-party flight and hotel inventory providers, normalising heterogeneous data formats in real time and achieving a **sub-200 ms median API response time** under simulated concurrent load.
- Designed a normalised **PostgreSQL schema** across 9 core domain tables — covering multi-leg itineraries, multi-currency pricing, room-type variants, seat classes, and dynamic availability windows — with full referential integrity and zero data-loss migrations.
- Implemented a **booking-lifecycle state machine** (searched → held → confirmed → issued / cancelled) with idempotent write semantics, preventing duplicate-booking race conditions under concurrent checkout requests.
- Built a **JWT-based authentication and role-scoped authorisation** system supporting traveller, agent, and admin access tiers, with refresh-token rotation and session invalidation on logout.

- Containerised the full stack using **Docker** with a multi-stage build pipeline and authored a **docker-compose** environment mirroring production topology, reducing engineer onboarding time from days to **under two hours**.
- Delivered a **Swagger / OpenAPI specification covering 65+ endpoints**, enabling the frontend team to begin parallel development with zero blocking dependencies and a shared contract from day one.

SELECTED PROJECTS

Switch Pay – *Go, Docker, PostgreSQL, Redis*

- Multi-provider payment orchestration engine with intelligent routing, automatic failover, idempotent retry logic, and webhook processing. github.com/Devkol-11/switch-pay

NetRoom – *Go, WebSocket, Redis, Docker*

- High-concurrency WebSocket chat engine handling **4,000+ simultaneous connections** with non-blocking goroutines and an AI thread-summarisation assistant at 0.3ms average latency. github.com/Devkol-11/NetRoom

Finx – *React, Next.js, PostgreSQL, Vercel*

- Peer-to-peer payments and savings platform with real-time transfers, goal tracking, and spending analytics — live in production. finx-web.vercel.app

GIG Link – *Node.js, PostgreSQL, Redis, Docker*

- Full gig marketplace connecting freelancers and creators, with job posting, proposal flow, and real-time notifications. github.com/Devkol-11/GIG-LINK

EDUCATION

Bachelor of Science in Statistics | *University of Lagos (Unilag), Lagos, Nigeria*

2019 – 2025
